

TV Week 7

Video: What's inside Goggle's Headquarters - Googleplex

Back on track (idiom) (снова на верном пути)	going in the right direction again after a mistake, failure, etc.	Their hard work has brought the project back on track .
Staff (n.) [sta:f] (персонал, сотрудники)	all the workers employed in an organization considered as a group	The IT staff at the company are responsible for maintaining the server facility and ensuring smooth network operations.
Stuff (n.) [stʌf] (вещи, материалы)	used to refer to a substance, material, group of objects, etc. when you do not know the name, when the name is not important or when it is obvious what you are talking about	The tech startup is working on some innovative stuff that could revolutionize the field of renewable energy.
Amenity (n.) [ə'mi:nɪtɪ] (удобство, благо)	a feature or service that makes a place pleasant, comfortable or easy to live in	The new research facility includes several amenities such as a state-of-the-art library, collaborative workspaces, and advanced laboratory equipment.
Facility (n.) [fə'sɪlɪtɪ] (объект, помещение, оборудование)	a building, service, equipment, etc. provided for a particular purpose	The university has invested heavily in a new engineering facility that includes advanced manufacturing tools and simulation software.
Seek (v.) [si:k] (искать, стремиться)	to look for something/somebody	The tech company is seeking to hire talented engineers who can help develop their next-generation products.

Text: User Experience Design

Non-linear (adj) [nɒn - 'lɪnɪə] (нелинейный)	not developing from one thing to another in a single smooth series of stages	The non-linear dynamics of complex systems require advanced engineering techniques to model and predict their behavior accurately.
Iterative (adj) [ɪ'tɜrətɪv] (итеративный, повторяющийся)	involving repeating a process or set of instructions again and again, each time applying it to the result of the previous stage	The iterative design process in engineering involves continuous refinement of prototypes based on feedback and testing results.
Tackle (v.) [tækəl] (браться за решение, справляться)	to make a determined effort to deal with a difficult problem or situation	Engineers must tackle the challenge of integrating AI into existing systems to enhance efficiency and performance.
Ill-defined (adj) [ɪldɪ'faɪnd] (нечётко определённый)	not clearly described	Ill-defined problems in engineering often require innovative solutions that involve reframing the problem statement.

Reframe (v.) [riˈfreɪm] (переосмысливать, менять постановку)	not clearly described	To reframe a complex engineering problem, teams use design-thinking methodologies to approach it from different angles.
User behavior (n.) (поведение пользователя)	a set of actions and patterns that users demonstrate when interacting with your product	Understanding user behavior is crucial in engineering technology to design interfaces that are intuitive and user-friendly.
Feature (n.) [ˈfi:tʃə] (функция, особенность)	something important, interesting or typical of a place or thing	The new software feature developed by the engineering team significantly improved the overall user experience.
Requirement(s) (n.) [riˈkwaɪəmənt(s)] (требование, требования)	something you must have in order to be allowed to do something or to be suitable for something	Identifying and articulating system requirements is a critical step in the engineering design process.
Ideation (n.) [aɪdɪˈeɪʃn] (генерация идей)	the process of forming ideas or images	The ideation phase in engineering involves brainstorming sessions to generate innovative solutions to complex problems.
Articulate (v.) [ɑːˈtɪkjələtɪt] (чётко выражать, формулировать)	to express or explain your thoughts or feelings clearly in words	Engineers must articulate technical specifications clearly to ensure that all stakeholders understand the project requirements.
Depict (v.) [dɪˈpɪkt] (изображать, описывать)	to describe something in words, or give an impression of something in words or with a picture	Diagrams are used to depict complex engineering systems in a way that is easy to understand for non-technical stakeholders.
Path (n.) [pɑːθ] (путь, способ достижения)	a plan of action or a way of achieving something	The path to innovation in engineering often involves exploring new technologies and methodologies.
Prompt (v.) [prɒmpt] (побуждать, вызывать)	to make somebody decide to do something; to cause something to happen	AI systems can prompt engineers with suggestions for design improvements based on historical data and performance metrics.
Node (n.) [nɒd] (узел)	a point, especially in the form of lump or swelling, where one thing joins another	In network engineering, each node represents a connection point that must be optimized for efficient data transmission.
Persona (n.) [pəˈsəʊnə] (персона, типовой портрет пользователя)	an archetypical user	Creating user personas helps engineers design products that meet the specific needs and preferences of their target audience.
Scenario (n.) [siˈnɑːrɪəʃ] (сценарий)	a brief stories about a person using your product or service to complete a specific task	Engineers use scenario planning to anticipate and prepare for potential future challenges in technology development.

User-flow (n.) (путь пользователя, схема действий)	a chart or diagram showing the path a user will take in an application to complete a task	Designing an intuitive user-flow is essential in engineering technology to ensure that users can navigate systems easily and effectively.
